I can prepare the complete University Scholarship Allocation — Python Activity Record based on your uploaded code. The file-generation capability is still unavailable to me, so I can provide the report content here, but I haven't created a downloadable Word document, flowchart image, or output screenshots.

University Scholarship Allocation

Python Activity Record — B.Tech First Year

1. Problem Statement

To develop a Python program that identifies students eligible for scholarships based on their average marks, mathematics marks, attendance percentage, and family income. The program generates a merit list by sorting eligible students according to their average marks, attendance, and name.

2. Objectives

- Calculate the average marks of each student.
- Check scholarship eligibility using specified conditions.
- Store eligible students in a list.
- Sort eligible students in descending order.
- Display student rank, name, average marks, and attendance.

3. Assumptions

- Student details are predefined in the program.
- Average marks must be at least 75.
- Mathematics marks must be at least 70.
- Attendance must be at least 85%.
- Family income must not exceed ₹2,50,000.
- The program generates a merit list but does not award scholarships automatically.

4. Algorithm

1. Start the program.
2. Store student details in a list.
3. Create an empty list for eligible students.
4. Read each student's details using a loop.
5. Calculate the average of mathematics, physics, and chemistry marks.
6. Check all four eligibility conditions.
7. If eligible, add the student's average, attendance, and name to the eligible list.
8. Sort the eligible list in descending order.
9. Display the merit list with ranks.

10. Stop.

5. Flowchart

Start

Store student details and create an empty eligible list

Calculate the average marks

Check average, mathematics marks, attendance, and income

Eligible

Add student to list

Not eligible

Skip student

Sort eligible students and display merit list

End

6. Pseudocode

```
BEGIN
   applicants = predefined student records
   eligible = empty list

   FOR each student:
      Calculate average marks

      IF average >= 75 AND
        mathematics >= 70 AND
        attendance >= 85 AND
        income <= 250000:
         Add average, attendance and name to eligible
      END IF
   END FOR

   Sort eligible in descending order

   DISPLAY "SCHOLARSHIP MERIT LIST"
```

```
    FOR each eligible student with rank:
        DISPLAY rank, name, average, attendance
    END FOR
END
```

7. Python Source Code

Your original uploaded Python source should be retained without changes in the final activity record.

8. Test Cases and Expected Output

Student	Average	Attendance	Result
Anu	86.67	92%	Eligible
Balu	77.67	88%	Eligible
Charan	81.33	86%	Eligible
Divya	82.00	95%	Not eligible — mathematics marks are below 70

The expected merit list from the supplied code is:

SCHOLARSHIP MERIT LIST

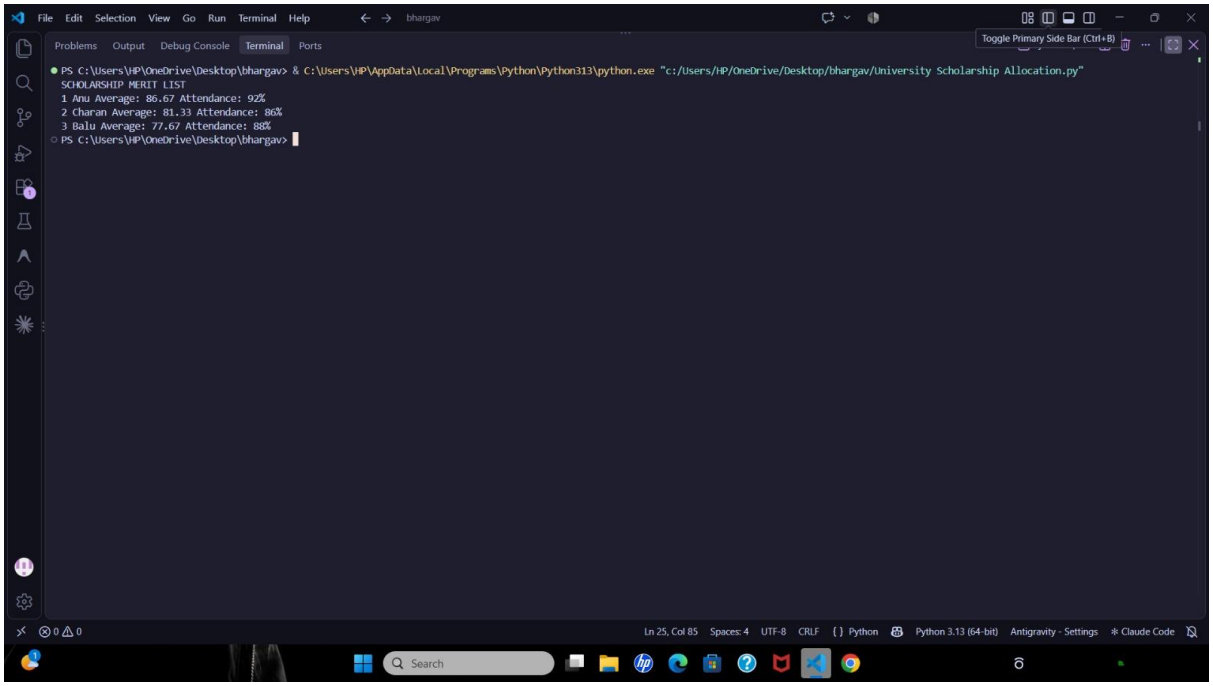

1 Anu Average: 86.67 Attendance: 92%

2 Charan Average: 81.33 Attendance: 86%

3 Balu Average: 77.67 Attendance: 88%

9. Output Screenshots

The screenshots still need to be created. The expected merit-list output is shown above; it is not a screenshot from an executed program.

10. Conclusion

The University Scholarship Allocation program demonstrates how Python lists, loops, conditional statements, average calculations, sorting, and enumeration can be used to automate scholarship eligibility screening and prepare a merit list. It provides a simple way to organize student information and identify students who meet the specified criteria.
